Iterator pattern is very commonly used design pattern in Java and .Net programming environment. This pattern is used to get a way to access the elements of a collection object in sequential manner without any need to know its underlying representation.

Iterator pattern falls under behavioral pattern category.

## Implementation

We're going to create a *Iterator* interface which narrates navigation method and a *Container* interface which retruns the iterator . Concrete classes implementing the *Container* interface will be responsible to implement *Iterator* interface and use it

*IteratorPatternDemo*, our demo class will use *NamesRepository*, a concrete class implementation to print a *Names* stored as a collection in *NamesRepository*.

## Step 1

Create interfaces.

*Iterator.java*

```
public interface Iterator {
    public boolean hasNext();
    public Object next();
}
```

*Container.java*

```
public interface Container {
    public Iterator getIterator();
}
```

## Step 2

Create concrete class implementing the *Container* interface. This class has inner class *NameIterator* implementing the *Iterator* interface.

*NameRepository.java*

```
public class NameRepository implements Container {
    public String names[] = {"Robert" , "John" , "Julie" , "Lora"};
```

```

@Override
public Iterator getIterator() {
    return new NameIterator();
}

private class NameIterator implements Iterator {

    int index;

    @Override
    public boolean hasNext() {

        if(index < names.length){
            return true;
        }
        return false;
    }

    @Override
    public Object next() {

        if(this.hasNext()){
            return names[index++];
        }
        return null;
    }
}
}

```

### Step 3

Use the *NameRepository* to get iterator and print names.

*IteratorPatternDemo.java*

```

public class IteratorPatternDemo {

    public static void main(String[] args) {
        NameRepository namesRepository = new NameRepository();

        for(Iterator iter = namesRepository.getIterator(); iter.hasNext();){
            String name = (String)iter.next();
            System.out.println("Name : " + name);
        }
    }
}

```

### Step 4

Verify the output.

```

Name : Robert
Name : John
Name : Julie
Name : Lora

```
