

AGES - SOLVED EXAMPLES

Advertisements

Q 1 - If the ratio of ages of two persons Ram and sham is 5:4 . After Three years their age ratio changes and becomes 11:9. In that case tell about the present age of mr. sham.

A - 23 years

B - 24 years

C - 25 years

D - 26 years

Answer - B

Explanation

If the age of Mr. Ram $5x$ and $4x$ is the age of Mr. sham.
Then, $(5x+3) / (4x+3) = 11/9 \Rightarrow 9(5x+3) = 11(4x+3) \Rightarrow x = (33-27) / 6 = 1$
So the present age of Mr. sham = $4 * 6 = 24$ years.

Q 2 - A mother is 30 time older in the comparison of her daughter. After the period of 18 year , the mother age would be thrice in the comparison of his daughter . In that case tell about the present age of mother.

A - 40 years

B - 41 years

C - 42 years

D - 43 years

Answer - A

Explanation

Let daughter present age be x year .
in that case mother present age would be = $30x$ years
 $30x + 18 = 3(x + 18) \Rightarrow 27x = 36 \Rightarrow x = 4/3$
 \therefore so the present age of mother = $(30 * 4/3) = 40$ years.

Q 3 - The ratio of present ages of three persons ajay , vijay and sanjay are in the proportion of 4: 7: 9. Before 8 year total sum of their age is 56. What should be the present ages?

A - 28 and 36 years

B - 28 and 38 years

C - 30 and 36 years

D - 36 and 28 years

Answer - A

Explanation

If the present age of ajay , vijay and sanjay is $4x$, $7x$ and $9x$ years.
Total sum of ages of ajay, vijay and sanjay before 8 years ago = $(4x-8)+(7x-8)+(9x-8)$
 $= (20x-24)$ years.
 $\therefore 20x-24 = 56 \Rightarrow 20x = 80 \Rightarrow x = 4$
Hence, it proves that age of ajay is $4*4 = 16$ years,
vijay $(7*4) = 28$ years and sanjay $(9*4) = 36$ years.

Q 4 - Daughter's present age is $\frac{2}{5}$ in the comparison of her mother .8 year later , age of her daughter will be $\frac{1}{2}$ in the comparison of her mother. Find out mother present age?

A - 39 years.

B - 40 years

C - 41 years

D - 42 years

Answer - B

Explanation

If the present age of mother is equal to x year.
In that situation the daughter present age would be = $\frac{2x}{5}$ years.
 $\frac{2x}{5} + 8 = \frac{1}{2} (x+8) \Rightarrow 4x + 80 = 5x + 40 \Rightarrow x = 40$.
The mother age at the present time is = 40 years.

Q 5 - Ajay age was double in the comparison of bhuvan before 3 years. Seven years hence, the sum of both ages would be 83 years. What should be the age at the present time of both?

A - 43 years

B - 44 years

C - 45 years

D - 46 years

Answer - C

Explanation

Before 3 year let bhuvan age be x years.
3 years before , ajay age will be $2x$ years.
Now Bhuvan's age = $(x+3)$ years and ajay age = $(2x+3)$ years.
 $(x+3)+7+(2x+3)+7 = 83 \Rightarrow 3x+20 = 83 \Rightarrow 3x = 63 \Rightarrow x = 21$
Now the bhuvan present age = $(21+3) = 24$ years
Now the ajay present age = $(2 * 21+3)$ years = 45 years.

Q 6 - I am 4 year older in the comparison of my sister, but my brother who is the youngest among us is 7 year younger to myself. My father is three times in the comparison of my brother. The present age of my sister 18 year and my father is 3 year older in the comparison of my mother. In that situation what should be the present age of my mother?.

A - 42 years

B - 43 years

C - 44 years

D - 45 years

Answer - A

Explanation

If my sister age is x years. Then,
Sister - x
I - $x+4$
Brother - $(x+4-7) = x-3$
Father - $3(x-3)$
Given $x = 18$
 \therefore Father's age = $3(18-3) = 45$ years.
Mother age = $(45-3) = 42$ years.

Q 7 - Ajay is as much younger to vijay as he is older to vinay. If 48 years is the sum of the ages of vijay and buwan . Then find out the present age of Mr. ajay ?

A - 21 years

B - 22 years

C - 23 years

D - 24 years

Answer - D

Explanation

$V-A = A-B \Rightarrow V+B = 2A = 48 \Rightarrow 24$
Now, We can say that the present age of Mr. Ajay is 24 years.

Q 8 - If 100 year is equal to the sum of the ages of father and son. 2:1 was the ratio of father and son before the period of 5 years. Find out the ratio of ages which would be after the period 10 year.

A - 3:4

B - 3:5

C - 4:3

D - 5:3

Answer - D

Explanation

If the age of father at the present time = x years
His son age at the present time = $(100-x)$ years.
 $x-5 / (100-x-5) = 2/1 \Rightarrow (x-5) = 2(95-x) \Rightarrow 3x = 195 \Rightarrow x = 65$
Ratio of the ages of man and son after 10 years = $(65+10)/(35+10) = 75/45 = 5/3 = 5:3$
