

# APTITUDE - BASIC ARITHMETIC

Advertisements

## Sequence

A sequence represents numbers formed in succession and arranged in a fixed order defined by a certain rule.

## Airthmetic Progression ( A.P.)

It is a type of sequence where each number/term(except first term) differs from its preceding number by a constant. This constant is termed as common difference.

### A.P. Terminologies

- First number is denoted as 'a'.
- Common difference is denoted as 'd'.
- $n^{\text{th}}$  number is denoted as ' $T_n$ '.
- Sum of n number is denoted as ' $S_n$ '.

### A.P. Examples

- 1, 3, 5, 7, ... is an A.P. where  $a = 1$  and  $d = 3 - 1 = 2$ .
- 7, 5, 3, 1, - 1 ... is an A.P. where  $a = 7$  and  $d = 5 - 7 = -2$ .

### General term of A.P.

$$T_n = a + (n - 1)d$$

Where **a** is first term, **n** is count of terms and **d** is the difference between two terms.

### Sum of n terms of A.P.

$$S_n = (n/2) [2a + (n - 1)d]$$

Where **a** is first term, **n** is count of terms and **d** is the difference between two terms. There is another variation of the same formula:

$$S_n = (n/2) (a + l)$$

Where **a** is first term, **n** is count of terms, **l** is the last term.

### Geometrical Progression, G.P.

It is a type of sequence where each number/term(except first term) bears a constant ratio from its preceding number. This constant is termed as common ratio.

### G.P. Terminogies

- First number is denoted as 'a'.
- Common ratio is denoted as 'r'.

- $n^{\text{th}}$  number is denoted as ' $T_n$ '.
- Sum of  $n$  number is denoted as ' $S_n$ '.

## G.P. Examples

- 3, 9, 27, 81, ... is a G.P. where  $a = 3$  and  $r = 9 / 3 = 3$ .
- 81, 27, 9, 3, 1 ... is a G.P. where  $a = 81$  and  $r = 27 / 81 = (1/3)$ .

## General term of G.P.

$$T_n = ar^{(n-1)}$$

Where  $a$  is first term,  $n$  is count of terms,  $r$  is the common ratio

## Sum of $n$ terms of G.P.

$$S_n = a(1 - r^n) / (1 - r)$$

Where  $a$  is first term,  $n$  is count of terms,  $r$  is the common ratio and  $r < 1$ . There is another variation of the same formula:

$$S_n = a(r^n - 1) / (r - 1)$$

Where  $a$  is first term,  $n$  is count of terms,  $r$  is the common ratio and  $r > 1$ .

## Arithmetic Mean

Airthmetic mean of two numbers  $a$  and  $b$  is:

$$\text{Arithmetic Mean} = (1/2)(a + b)$$

## Geometric Mean

Geometric mean of two numbers  $a$  and  $b$  is

$$\text{Geometric Mean} = \sqrt{ab}$$

## General Formulaes

$$1 + 2 + 3 + \dots + n = (1/2)n(n+1)$$

$$1^2 + 2^2 + 3^2 + \dots + n^2 = n(n+1)(2n+1)/6$$

$$1^3 + 2^3 + 3^3 + \dots + n^3 = [(1/2)n(n+1)]^2$$
